

What is claimed is:

1. A method of network navigation using a computer system, the method comprising:

5 displaying a group indicator associated with at least one bookmark group that includes a number of group-associated bookmarks that are maintained on a remote computer system;

accessing a locator for each of the group-associated bookmarks from the remote computer system, upon an occurrence of a selecting action directed at
10 the group indicator; and

displaying a number of bookmark indicators, each of the bookmark indicators being associated with a respective one of the group-associated bookmarks.

15 2. The method of claim 1, wherein the accessing includes accessing the bookmark indicators from the remote computer system.

3. The method of claim 1, wherein the accessing includes downloading a web page from the remote computer.

20 4. The method of claim 3, wherein the accessing further includes parsing source code of the web page to extract the locators.

25 5. The method of claim 4, wherein the parsing includes extracting the bookmark indicators from the source code.

6. The method of claim 4, wherein the parsing includes examining the source code for anchor tags.

30 7. The method of claim 6, wherein the parsing includes examining the tags to determine whether links associated with the anchor tags are local links.

8. The method of claim 6, wherein the parsing includes extracting text from the anchor tags for the bookmark indicators.

5 9. The method of claim 1, wherein the selecting action includes clicking on the group indicator.

10 10. The method of claim 1, wherein the bookmark indicators are stored on the computer system, and wherein the displaying includes displaying the stored bookmark indicators.

11. The method of claim 10, wherein the stored bookmark indicators are updated by periodically performing the downloading and the determining.

15 12. The method of claim 1, wherein the accessing includes accessing at least one bookmark file on the remote computer.

13. The method of claim 12, wherein the at least one bookmark file include at least one file in a standard bookmark file format.

20 14. A computer program embodied in a computer readable medium, for network navigation, comprising:

code that displays a group indicator associated with at least one bookmark group that includes a number of group-associated bookmarks that are maintained on a remote computer system;

25 code that a locator for each of the group-associated bookmarks from the remote computer system, upon an occurrence of a selecting action directed at the group indicator; and

code that displays a number of bookmark indicators, each of the bookmark indicators being associated with a respective one of the group-associated
30 bookmarks.

15. The computer program embodied in the computer readable medium of claim 14, wherein the code that accesses includes code that accesses the bookmark indicators from the remote computer system.

5 16. The computer program embodied in the computer readable medium of claim 14, wherein the code that accesses includes code that downloading a web page from the remote computer.

10 17. The computer program embodied in the computer readable medium of claim 16, wherein the code that accesses further includes code that parses source code of the web page to extract the locators.

15 18. The computer program embodied in the computer readable medium of claim 17, wherein the code that parses includes code that extracts the bookmark indicators from the source code.

20 19. The computer program embodied in the computer readable medium of claim 17, wherein the code that parses includes code that examines the source code for anchor tags.

25 20. The computer program embodied in the computer readable medium of claim 19, wherein the code that parses includes code that examines the tags to determine whether links associated with the anchor tags are local links.

30 21. The computer program embodied in the computer readable medium of claim 19, wherein the code that parses includes code that extracts text from the anchor tags for the bookmark indicators.

35 22. The computer program embodied in the computer readable medium of claim 14, wherein the code that accesses includes code that accesses the locators in response to a clicking on the group indicator.

23. The computer program embodied in the computer readable medium of claim 14, wherein the code that accesses includes code that accesses at least one bookmark file on the remote computer.

5 24. The computer program embodied in the computer readable medium of claim 23, wherein code that accesses the at least one bookmark file includes code that accesses at least one file in a standard bookmark file format.

10 25. A system for network navigation, comprising:
a processor coupled to a local interface;
a memory coupled to a local interface; and
processing logic stored on the memory and executable by the processor
including:

15 logic that displays a group indicator associated with at least one bookmark group that includes a number of group-associated bookmarks that are maintained on a remote computer system;

 logic that accesses a locator for each of the group-associated bookmarks from the remote computer system, upon an occurrence of a selecting action directed at the group indicator; and

20 logic that generates a display that includes a number of bookmark indicators, each of the bookmark indicators being associated with a respective one of the group-associated bookmarks.

26. A system for network navigation, comprising:

means for displaying a group indicator associated with at least one bookmark group that includes a number of group-associated bookmarks that are maintained on a remote computer system;

5 means for accessing a locator for each of the group-associated bookmarks from the remote computer system, upon an occurrence of a selecting action directed at the group indicator; and

means for displaying a number of bookmark indicators, each of the bookmark indicators being associated with a respective one of the group-associated bookmarks.

10

27. A method of network navigation using a computer system, the method comprising:

displaying a group indicator associated with at least one bookmark group that includes a number of group-associated bookmarks that are maintained on a remote computer system;

15

accessing a locator for each of the group-associated bookmarks from the remote computer system, upon an occurrence of a selecting action directed at the group indicator, wherein the accessing includes:

20 downloading a web page from the remote computer; and
parsing source code of the web page to extract the locators,

wherein the parsing includes:

extracting the bookmark indicators from the source code;
examining the source code for anchor tags; and
25 extracting text from the anchor tags for the bookmark indicators; and

displaying a number of bookmark indicators, each of the bookmark indicators being associated with a respective one of the group-associated bookmarks.

30
